Batteries

Lithium-iron-phosphate (LiFePO4 or LFP) is the safest of its family. Also does not need to be fully charged to perform correctly. Service life even slightly improves in case of partial charge instead of a full charge. This is a major advantage, in addition, its wide operating temperature range, excellent cycling performance, low internal resistance and high efficiency.

LFP is therefore the chemistry of choice for very demanding applications

The degradation curve vs different DoD @400cycles/year at 25℃
Terms:

SOC%: State of Charge, measures the remaining energy content in a battery

SOH%: State of Health, ratio of the recharging capacity, compared to a new battery

DOD%: Depth of discharge, defines the energy consumed in the battery

Cycle: Complete charge and discharge of its usuable energy stored (DoD%)

EoL%: End of life, SOH is at this value

Inverter

Power electronics that combines inverter and charger. It is needed to transform the energy supply from batteries (DC) to the loads (AC) with or without additional sources as diesel generators or grid.
